

## Annotated Corpus of Pre-Standardized Balkan Slavic Literature

corpus link - <http://hdl.handle.net/11356/1368>

version date - 4.11.2020

Ivan Šimko, University of Zurich

### 1. Introduction

The following document describes the properties of our corpus of pre-standardized Balkan Slavic literature. The sources for this corpus are *pre-standardized*: they can be dated in the period before the debate on the standardization of modern Bulgarian began to level the existing dialectal differences between the literary traditions. In the present stage, the earliest sources can be dated to 16th century, the latest to the first half of the 19th century.

The linguistic category of *Balkan Slavic* encompasses roughly the Bulgarian, Macedonian and adjacent dialects in Serbia (Torlak). While this category can be understood in geographic terms, it is primarily a linguistic one: it represents varieties of Slavic, which have undergone convergent developments together with neighboring non-Slavic varieties in the area, including Albanian, Romani, Romance, modern Greek and Gagauz Turkish. Not all of the sources have been produced in the area with a majority of populace speaking a Balkan Slavic dialect. Philological metadata for each source specify approximate affiliation of authors or scribes within broader dialectal areas (e.g. West Macedonia, Northwestern Bulgaria...) or literary standards (Church Slavonic and its redactions).

Finally, the corpus includes works of *literature*. Each source can be seen as an integral product of a single scribe, but it also can be situated within a broader scope of a literary tradition, which in many cases reaches beyond the borders of a national literature or the respective period. Each source reflects not only phonetic and grammatical features of the scribe's individual language variety, but also the relation between the scribe and existing literary traditions and the local dialect: the scribe's desire to sanctify the text by using archaic grammatical features, or to democratize it by stylistics of secular storytelling and the use of popular loanwords. Thus, each source includes implicit information about its purpose: enlightenment of a non-educated auditory, preservation of a collective memory and symbolics, and so on.

The purpose of the corpus is to provide a resource basis for philologically informed quantitative studies concerning the development of Balkan Slavic languages, focusing on the features characteristic of this group within the Slavic family.

### 2. Background

Balkan Slavic dialects have undergone complex morphosyntactic changes in the last (at least) five centuries. For example, case inflection, which can be observed in the oldest (Old Church Slavonic, OCS) texts from the Balkan area and other Slavic languages, has been limited to the pronominal paradigms, which are also simplified to the point of a simple distinction between a nominative and a single oblique case, with some dative forms. Morphosyntactic functions formerly expressed by inflectional cases received new analytic means of expression. Synthetic possessive constructions with genitive (e.g. *duxъ otъca vašego* 'the spirit of your father' in OCS; Lunt 2001:146), dative (*syni světu* 'the sons of the light'; Lunt 2001:149) or adjectives (*učenici ioanovi* 'the disciples of John'; Lunt 2001:146) have been replaced by constructions with clitic dative pronouns (e.g. *nai mladīa+ mu sīnъ* 'his youngest son', PPS 80v),

orthographic words, numbers). This layer makes the lemmatization easier, and also helps us to train automatic recognition of morphological markers.

- iii. **Lemmatization.** Individual literary sources have different vocabularies. The words uncommon in modern literary Bulgarian were lemmatized mostly according to the specific dictionary based on the *Tixonravov damaskin* (Demina et al. 2012), supported by Church Slavonic (Miklosich 1865, Cejtin 1996) and dialectal Bulgarian (*Bulgarian Etymological Dictionary* 1972-2006) dictionaries. In rare cases of loanwords not reflected in the dictionaries mentioned above, new lemmas were introduced using roots from Turkish or other donor languages. The lemmatization helps us also to cope with orthographic differences, especially in works radically adhering to phonetic principles.
- iv. **Annotation.** Tags are assigned to individual words (tokens) to describe their morphological and syntactic features. The tagset has been customized to reflect not only productive features of modern Bulgarian and Macedonian, but also those of Church Slavonic and of other Balkan Slavic dialects. Morphological annotation contains a tag based on the MultextEast (ME) standard. Syntactic annotation is based on the Universal Dependencies (UD) system. As these are the main tools for capturing the morphosyntactic variety of Balkan Slavic, we will explain this step in more detail in the following paragraphs.

### 3. Data Sources

The sources of the corpus are digital transcripts of various manuscripts and printed books originating (or written by authors or scribes from) the Balkan Slavic area. The sources were chosen in order to cover as much dialectal areas and periods as possible. However, an exact localization in space and time is not always possible, especially in case of older manuscripts. So far the sources are labelled by the conventional name (abbreviated) of the edition.

source	date	language variety	text	sentences	tokens
Vuković 1536	1536	Church Slavonic	<i>Life of St Petka</i>	147	2222
<i>Tixon.d.</i>	early 17th	Bela Slatina-Pleven	<i>Life of St Petka</i>	274	2472
<i>Lov.d.</i>	early 17th	Central Balkan	<i>Homily on Drinking</i>	98	704
<i>Ljub.d.</i>	late 17th	Kotel-Elena	<i>Life of St Petka</i>	276	2503
<i>NBKM 328</i>	1750	Samokov	<i>Legend of St Thais</i>	131	895
<i>Temski r.</i>	1764	Torlak	<i>Homily on Children</i>	225	2145
<i>NBKM 1069</i>	1776	Panagjurište	<i>Homily on Divination</i>	112	1168
<i>NBKM 1423</i>	1778	Paulician	various	242	2926
<i>NBKM 370</i>	1784	Slavenobulgarian	introduction	111	1214
<i>PPS</i>	1796	Vidin-Lom	<i>Joseph, St Petka</i>	529	3724
<i>Berl.d.</i>	1803	Moesian	<i>Life of St Petka</i>	454	4853
<i>Nedělnik 1806</i>	1806	Slavenobulgarian	<i>Life of St Petka</i>	216	2215
<i>NBKM 1081</i>	1821	Pirdop-Koprivštica	<i>Daniel's Prophecy</i>	145	1249
<i>NBKM 1064</i>	1820s	Subbalkan	<i>Life of St Petka</i>	337	3705
<i>NBKM 728</i>	1830s	Tetovo	<i>Life of St Petka</i>	97	686

The corpus contains multiple versions of the *Life of St Petka* (or *Parascheva*), a Church Slavonic hagiography composed by Patriarch Euthymius of Tarnovo in the late 14th century. The oldest source (Vuković 1536) contains a shortened version, which was later added to manuscripts containing a translation of homilies by Damaskēnos Stouditēs (†1577), hence called *damaskini*. Among these, the

damaskini of Tixonravov (*Tixon.d.*), Ljubljana (*Ljub.d.*), Lovech (*Lov.d.*), and Berlin (*Berl.d.*) were included to represent the four major editions of *damaskini* manuscripts in the popular language ("simple Bulgarian"), as described by Demina (1968:53-64). The late Greek-script *damaskin NBKM 1064* also belongs to this text tradition. Manuscript *NBKM 1423*, written with Latin letters, represents another, Catholic tradition of hagiographic texts. Most of the other manuscripts among our sources are also eclectic compositions of hagiographies and homilies from various authors (*NBKM 328, 728, 1069, 1081, PPS, Temski r.*). Among these, the *sbornik* of Pop Punčo (*PPS*) will be released with full annotation as a whole later. The printed *Nedělnik 1806* by Sophronius, Bishop of Vratsa (†1813) shows a similar eclectic structure as the *damaskini* too.

Although the language of the *damaskini* is also sometimes considered a "literary standard", as it combines features of various Balkan and Western dialects of Bulgaria (cf. Velčeva 2001, Mladenova 2007). However, later examples (*Berl.d., NBKM 1064*) deviate much from the 17th century norms. For this reason, we classify them according to dialectal areas of the place of their approximate origin (based on Stojkov 2002). The language of the collections *NBKM 1069* and *1081* shows considerable influence of the *damaskini* language, too.

The language varieties include two quasi-standards. The first is the traditional Church Slavonic, used in Vuković 1536. The second is "Slavenobulgarian", a variety developed on the basis of Western Bulgarian dialects with many archaic features in the 18th century. Its major example is the *Slavenobulgarian Chronicle* by hieromonk Paisius of Hilandar. The corpus includes the introduction of the *Chronicle* from the transcript produced in Elena (*NBKM 370*). The manuscript *NBKM 328* by Josif Bradati likely presents an early variant of this variety. The choice is aimed at covering an as wide as possible area (also see the map 9.1. at the end of the article):

<b>dialectal area</b>	<b>source</b>
Balkan	<i>Ljub.d., Lov.d., NBKM 1064, 1069, 1081</i>
Macedonia	<i>NBKM 728</i>
Moesian	<i>Berl.d.</i>
Northwestern	<i>PPS, Tixon.d.</i>
Rup	<i>NBKM 1423</i>
Torlak	<i>Temski r.</i>
Western	<i>NBKM 328</i>
Slavenobulgarian	<i>NBKM 370, Nedělnik 1806</i>
Church Slavonic	Vuković 1536

The majority of the sources (*Berl.d., Ljub.d., NBKM 370, 728, 1064, 1069, 1081, 1423, Nedělnik 1806, PPS, Vuković 1536*) were provided as digital copies in the respective libraries. The rest (*Lov.d., Temski r., Tixon.d.*) was transcribed on the basis of critical editions.

#### 4. Data Structure

Each source is provided in a separate file. The files use the text encoding UTF-8, which is likely to stay as a standard for a while. They are provided in two formats: the first format is a simple tab-separated text file, which can be open both in table (e.g. MS Excel) and text editors (e.g. Notepad), and is easy to convert to other formats. The files are also provided in the CoNLL-U format, which is compatible with the interface of the repository.

Text tables are per default organized in 12 columns. The first column (TOKEN) contains the main transcript, including interpunction, suprasegmental markings, and distinguishing graphematic variants.

The second column (DIPLOMATIC) contains a transcript using a simplified character set, which is more easily searchable. The third column (LEMMA) provides lemmas in basic forms - nominative singulars for nouns, pronouns and adjectives, and 1st person present for verbs. In general, the basic form was chosen according to widely available Bulgarian and Macedonian dictionaries. If the word is not mentioned in them, other (Church Slavonic, Turkish; cf. above §2.iii) dictionaries were used to determine the lemma.

The following columns include codes (tags) for morphological and syntactic information about the token (POS\_TAG, POS\_EXT, SENT\_ID, UD\_ID, UD\_NCY, UD\_TYPE, UD\_EXT). The following column (FOLIO) shows the page number at the first token of the page. The pages are usually numbered per folio on the right side, but multiple numberings (e.g. a Cyrillic one by the author, Arabic by the library) may be given as well. The following column (TRANSLATION) contains the English translation of the whole sentence. It is usually placed at the first token of the sentence. If the sentence is complex or its syntax is broken, the translation may be provided for each logical part (clause), each starting at the first token of these parts. Some of the sources adapted for critical philological editions also have an additional column with information marking end of lines in the original edition (EOL). If multiple chapters are included from a source (like in *PPS* and *NBKM 1423*), beginnings of particular chapters are marked in another column (CHUNK), which also can be used to mark narrative components of a story (e.g. for parallel comparisons between various editions).

The CoNLL-U files use the standardized structure ([link](#)). Primary morphological tag has been reflected as the "language specific" tag (XPOS). However, format-specific limitations prevent the use of all information, which is available in text tables.

## 5. Morphological tagset

The corpus uses a tagset based on the Multext-East system of morphosyntactic annotation ([link](#)). It is roughly based on the specifications for modern Bulgarian, Macedonian and Croatian. The tag is composed of a string of (max. 6) characters, in which the first capital letter defines the basic part-of-speech category, followed by lower-case characters for morphological attributes. For example, the word *jasna* FEM.SG 'clear' receives the tag AFSNN, containing the following information based on the ending *-a*:

A	adjective (part-of-speech)
F	gender: FEM (i.e. not <i>*jasen</i> or <i>*jasno</i> )
S	number: SG (not <i>*jasni</i> )
N	case: NOM (not <i>*jasnu</i> , <i>*jasnyę</i> etc.)
N	(old) definiteness: short-form (not <i>*jasnaa</i> )

Due to transitional character and diversity of the language of our sources, the set was customized to reflect both the features, which became unproductive later, as well as the ones, which are recent. The morphological tags do not reflect the function of the morphem (e.g. definiteness, possession), which is thus left for the interpretation of measurements. They are strictly form-based, reflecting the realization of the word in the annotated text. Some desinences are ambiguous: for example the noun ending *-a* can denote not only FEM.SG.NOM, but also MASC.SG.GEN/ACC in older texts, MASC.SG shortened article, MASC.DL.NOM, NEUT.PL.NOM; they can be distinguished only by lemmas or context. Thus all the tag positions after the category marker interpret the desinence together.

## 5.1. Nouns

The tag includes four attributes. We distinguish grammatical gender (1), number (2), case (3), and animacy (4). Gender, number, and (at least in CS) case are marked at all elements of the noun phrase. Animacy is a lexical attribute, but it may have an effect on the paradigm. The case attribute serves to classify the graphic shape of the ending; it does not necessarily denote the morphosyntactic role of the noun. Nouns are classified either according to gender and historical stem classes (*osnova*), based on pre-Slavic SG.NOM endings (cf. Lunt 2001:54), or according to the generalized paradigms for respective genders. This is usually a choice specific for a text, but it may vary between various texts within a source (e.g. in *Tixon.d.*).

5.1.1. Tagset for nouns. Bold script marks options commonly met in newer (i.e. non-CS) texts.

### - N-gender-number-case-animacy

- Gender:

M - masculine

F - feminine

N - neutral

- Number:

S - singular

P - plural

D - dual

- Case:

- singular:

**N - MASC -ъ, FEM -а/ѧ, NEUT -е/о**

G - MASC -ов, MASC/FEM -ѧ, NEUT -ѧи

D - MASC/NEUT -ом/ем, FEM -ам

L - MASC/FEM/NEUT -ex/ax

I - MASC/FEM/NEUT -ми

- dual:

**N - MASC -а, FEM -е, NEUT -и**

G - MASC/FEM/NEUT -у

D - MASC/FEM/NEUT -ама

- Animacy: Y/N

5.1.2. Differences from legacy tagsets

The Bulgarian tagset (BG) marks five attributes. The first attribute distinguishes common and proper nouns. This distinction was deemed redundant, being merely semantic one. Our corpus also contains a number of words ambiguous from this aspect (*Gospod* 'Lord [God]', *Bogorodica* 'Mother of God'). The last position, instead of marking animacy, denotes definiteness. In our set, the postponed article is usually not treated as a suffix. As long as they include the demonstrative root (see below §5.3.4.), articles are handled as separate tokens. This enables us to compare their use with short demonstrative pronouns used in Church Slavonic (CS). Only shortened articles (-а, dialectal -ѧ, -о) are marked on the noun or adjective. When they are graphically identical to a case marker, they are annotated as such (e.g. in *diavola se prestruvaže* 'the Devil clothed himself': NMSGY, *Nedělnik* 1856: 257).

The BG tagset distinguishes only two options for the case attribute: nominative and vocative. Additionally, the Macedonian (MK) set distinguishes an oblique case, too. Our marking of cases is based on the Croatian (HR) tagset, which is used also in sets for other Slavic languages, like Russian and Slovak. The situation in HR is comparable to an earlier stage reflected in CS literature. The option "oblique" has been adopted for situations, where the shape of the ending is different from the CS cases, as defined above.

1. shortened MASC.SG article	-o	<i>stolpo</i> 'the pillar' (PPS)
2. anlaut of a MASC.SG article	-o(t)	<i>posniko+ t</i> 'the hermit' (NBKM 728)
3. borrowed agent nouns	-ija	<i>gemeψiā</i> 'sailor' (Ljub.d.)
4. Bogorov's FEM.SG.OBL marker	-ǝ	<i>čistotǝ</i> '[due to her] purity' (Nedělnik 1856)
5. <i>damaskini</i> FEM.SG.OBL marker	-b	<i>dšb+ta</i> '[she gave] her soul' (Tixon.d.)

5.1.3. Phonetic and graphic ambiguities (e.g. differences between *i/y* or *e/ě*) are resolved by a convention based on the development of the sounds in the approximate area of origin of the text, the writer or his orthographic school (e.g. *y* → *i*, *ě* → *e* for the majority of today's Bulgaria). Ambiguous case markers are marked conventionally according to their final shape, even if the ending would be syntactically interpreted otherwise. The convention is based on the traditional order of cases in paradigms (NOM-GEN-DAT-ACC-LOC-INST). Locative is marked only if its realization would be different from the dative (e.g. *v'+ životě svoémъ*: NMSLN; but *na zemli* 'on Earth': NFDN; *Nedělnik* 1806). The short forms for FEM.SG.GEN and DAT are distinguished according to the stem. Old *a*-stems (ending in a hard consonant) have *-i* (< OCS *-y*) as their SG.GEN ending (e.g. *pet'ki sláva* 'glory of Petka': NFDN; *Tixon.d.*). Old *ja*-stems (with a palatal consonant) have *-e* (< OCS *-ě*) here (e.g. *do zemlje* 'to the ground': NFDN; *Tixon.d.*). If an OCS fem.sg.acc *-ǝ* would occur (if we include an older CS text like *Dobr.ev.* or *NBKM 667*), it would be marked as an *o*-case. Old FEM.SG *i*-stems ending in an *-i* are marked always as genitives. Various FEM.ACC.SG forms (*-u*, *-b*) are handled with separate markers; both A and O forms may occur in the same text. Vocatives (which may be graphically indistinguishable from locatives) are marked as such, if their function is clear from the context.

5.1.4. Old *a*-stem MASC nouns (e.g. *bašta* 'father') are handled as FEM nouns.

5.1.5. Marking of dual forms follows gender-specific rules. Some originally dual forms were generalized as plurals (*kraka* 'legs'; *ručě* 'hands'; *oči* 'eyes'), appearing alongside plural forms of adjectives and pronouns in noun phrases. The MASC ending *-a* is handled as a dual in count forms (cf. Mirčev 1978:195; Maslov 1981:149), i.e. when numerals are included in the noun phrase (e.g. *četèri děla* 'four parts': NMDNN; *NBKM 1081*).

5.1.6. Adverbs based on old instrumentals are also tagged according to the shape of the ending. Adverbs with the full ending are tagged as nouns, if the ending is equal to one present in the paradigm of the respective gender and stem class (e.g. *tičš'kom* 'running': NNSIN; *Berl.d.*). If the adverbial ending is different from any in the paradigm, the token is tagged as an adverb (e.g. *noštjā* 'in the night': R; *NBKM 1064*).

## 5.2. Adjectives

Similarly as nouns, adjectives distinguish four attributes. The gender (1) and number (2) are in the same positions. Case (3) is distinguished in CS in all genders, but in "simple" Bulgarian of the *damaskini* only in MASC.SG adjectives systematically. Adjectives also vary according to complexity, the old expression of definiteness (4).

5.2.1. Tagset for adjectives. Bold script marks options commonly met in newer texts.

### - A-gender-number-case-complexity

- Gender: F/M/N

  - D - MASC/FEM/NEUT *-im*
  - A - MASC *-ee*
  - I - MASC/FEM *-imi*
- (old) Definiteness :  $\Upsilon$ /N

### 5.2.2. Differences from legacy tagsets

Adjectives are tagged differently between the respective tagsets: e.g. MK set marks gender in position (2), while BG and HR mark it on the third. The case system is comparable to the HR set, with an additional *o*-case for specific situations (cf. §5.2.5.). Animacy, marked in the HR set, is not included in our system, as it does not have an influence upon the morphology of adjectives. Degree, known from the HR and MK sets, is not marked, because the relevant markers *po* and *nai* are handled as separate tokens (while CS examples of synthetic marking are too rare in our corpus).

Old definiteness or complexity is marked as "Definiteness" in the code, basing on the HR set, although it is not equal: it denotes the difference between short and long forms only. Articles are tagged as separate tokens.

5.2.3. In standard Bulgarian, the short form is prevalent throughout the paradigm; besides few lexicalized exceptions (e.g. MASC.SG *vtori* 'second'), only MASC.SG adjectives with an article follow a long form (e.g. MASC.SG.DEF *visokijat* 'the high'). The definiteness marking by the variation of short and long forms seems to be limited to CS and Serbian texts (Lunt 2001:59, 66), but it was also reported in some Moesian dialects up to the modern times as well (Mladenov 1963). However, doubling of letters representing /i/, likely inspired by the MASC.SG.LF, can also be found on unexpected places in the texts (e.g. adverbs like *junaški* 'heroically'). Non-nominative short-forms are rare in the damaskini; the long forms were likely generalized before the loss of inflection. As with nouns, archaic, non- or pre-standardized variants (e.g. *visokъt*, *visokii*, *visoka*) should be all covered by combinations of the boolean longform marker and case.

5.2.4. Ambiguous shortforms are resolved in the same way as nouns, i.e. according to stem and etymology. The MASC.SG.LOC ending *-om* appearing in Serbian sources and *Nedělnik* is handled as  $\mathfrak{I}$  (e.g. *na presvētlomъ prestólě*: AMSIN; Vuković 1536). The irregular adjective *vsem* 'all' (< OCS MASC/NEUT.SG.LOC.SF/LF *vъsemъ* or MASC/NEUT.SG.INST.LF *vъsěmъ*) is resolved in the same way (as AMSIN). The one vocative form is marked only if other

elements of the noun phrase have a vocative ending, considered a short form (e.g. *fariseju slěpe* 'o blind Pharisee!': AMSVN; Lunt 2001:142).

5.2.5. The so-called *o*-cases are marked according to the rules defined for nouns. It can be used only with sg long forms: for example, *zliio+ tь* 'the bad' (*Dobr.ev.*) is analyzed as a long form adjective with an *o*-case ending (AMSOY) and as a separate article (PD-MSN).

### 5.3. Pronouns

All pronouns are tagged according to their type (1), distinguishing e.g. demonstrative and indefinite ones. Person (2) is tagged only in personal pronouns. Gender (3), number (4) and case (5) are tagged in nominal pronouns of relevant types. For economic reasons, adjectival pronouns (e.g. *svoi, njakakъv*) are tagged as adjectives (e.g. *někoja carica* 'a queen': AFSNY; but *koi može iskaza* 'who could tell': PQ--N; both *Tixon.d.*). The determiner function of such elements is expressed in the syntactic annotation.

#### 5.3.1. Tagset for pronouns.

##### - P-type-person-gender-number-case

##### - Type:

D - demonstrative (e.g. *tazi, onova, -tь, onъ*)

I - indefinite (e.g. *njakoi*)

P - personal (e.g. *az*)

Q - interrogative (e.g. *koi, što, kolko*)

R - relative (e.g. *deto, štoto, toko, takъvzi*)

X - reflexive (*sebe, si, se*)

Z - negative (e.g. *nikoi*)

##### - Person: 1/2/3

##### - Gender: F/M/N

##### - Number: S/P/D

##### - Case:

N - unmarked/general case (e.g. *az, ti, nie, koi*)

G - long G/A forms: *mene, tebe, nego, neja/nju, nas, vas, těx/nix, kogo*

D - *mi, ti, nemu/mu, nei/i, nam, vam, im/gim/xim, komu*

A - short G/A forms: *me, te, go/ego, ja/eę/gu, ni, vi, gi/ix/xi*

L - e.g. *mně, něm, nix, kom*

I - e.g. *mnoju, nimi, kym/cěm*

O - e.g. *tъzi*

#### 5.3.2. Differences from legacy tagsets

The BG and HR sets use longer strings (up to 13 characters) to reflect various nominal and adjectival attributes at once. Our system is closer to the MK set, but it removes the clitic attribute at position (6), which is obsolete due to use of syntactic marking, as well as the definiteness attribute (7), which is only relevant for adjectival pronouns (which we handle as adjectives). The number of options for the case attribute is extended according to the HR set. The *o*-case attribute is used only for FEM.SG.OBL demonstratives (cf. §5.1.2.).

5.3.3. Conventions are set to eliminate paradigmatic and phonetic ambiguities: e.g. OCS *meně* is clearly a 1SG.GEN, but in modern Bulgarian it could also reflect 1SG.ACC. In both cases they would be annotated as PP1-SG.

5.3.4. Articles, i.e. postponed short demonstrative pronouns, are marked as separate tokens, so that the tagset is compatible with Church Slavonic sources, where their clitic character is unclear. Unlike adnominal demonstratives they occur after the word, for which they serve as a determiner. Marking of articles as separate tokens allows us to analyze their declension, as well as the (dialectally relevant) phonetic character of the hiatus vowel, emerging at the end of MASC.SG.NOM nouns carrying the articles. The position after the noun or adjective is tagged by an extension in the syntactic annotation (§6.2.2.).

5.3.5. Gender and number are conventionally not marked on indefinite, interrogative, and negative pronouns. Case can be marked, if the referent is a person (e.g. *kogò*: PQ---G; *Berl.d.*). Individual sources (*NBKM 370*, *Nedělnik 1806* and *Temski r.*) make a difference between SG and PL.NOM (e.g. *ktò*: PQ---SN, while *koí*: PQ---PN; *Nedělnik 1806*). If the form is ambiguous (e.g. because of using unaccented *koi* for both numbers), number is excluded from the tag. Tags for demonstrative and relative pronouns, as far as analyzable as nominal pronouns, include gender and number (e.g. *koéto*: PR-NSN; *Berl.d.*) too.

5.3.6. Pronouns used in possessive constructions are handled as adjectives (e.g. *negov* 'his') or as personal pronouns (e.g. M.3SG.DAT *mu*). Possessive function is marked in the syntactic annotation as a tag extension: the pronoun is tagged as a dependent on the noun expressing the possessed object (NMOD:POSS, cf. §6.2.1.). The attributes "owner number" and "gender" (used in the HR tagset) were not included in the tagset.

5.3.7. The type of the pronoun is marked according to the attached morpheme to the main root. A pronominal root without a suffix is always marked as interrogative pronoun, even if the author uses it e.g. as a relative pronoun (e.g. *kogí po\_tražíxu 'i+ naídoxu čášu* 'as they searched, they found the cup'; *PPS*):

interrogative	(none)	<i>koga</i> 'when'	PQ
negative	<i>ni-</i>	<i>nikoga</i> 'never'	PZ
indefinite	<i>ně-, (v)sě-</i>	<i>někoga</i> 'sometimes'	PI
relative	<i>-to</i>	<i>kogato</i> 'as'	PR

The following roots are tagged as pronouns: *gde*, *kak(o)*, *какъv* (with suffix *-to*), *koga*, *kogda*, *kolko*, *къде*, *такъv* (with suffixes *-va* or *-zi*), *togda*, *tolko*.

## 5.4. Numerals

Only one attribute (type) is included in the tag. Due to their lexical and morphological traits, ordinal numerals are marked as adjectives in our system (e.g. *vtóri* 'the second one': AMSNY). If the category is ambiguous, a secondary tag can be added (e.g. PL.GEN *oboix* 'both': ML and AMPGY; count form *dvama* 'two': ML and NFSNN). As with nouns and adjectives, collective numerals and articles are marked as separate tokens (e.g. *dvama+ ta* 'the two'). Compound numerals (e.g. category 11-19: *četir+ na+ iset* '14') are split into multiple tokens. Cyrillic numerals are marked by two asterisks at the beginning and the end of the string in the corpus; the marking in the original text may vary, usually containing a title over the letters.

### 5.4.1. Tagset for numerals.

#### - M-Form

- Form:

- C - alphabetic (e.g. \*dl\*)
- D - digital/arabic (e.g. 14)
- L - letter (e.g. *četir+na+iset*)
- R - roman (e.g. XIV)

### 5.4.2. Differences from legacy tagsets

The form attribute is used in the MK set. The "alphabetic" option has been added to mark Cyrillic numerals. In future, it might be used to mark other alphabetic numbering systems (e.g. Greek, Hebrew...) as well. Due to our handling of ordinal numerals as adjectives, other attributes were considered redundant for our system.

## 5.5 Verbs

We distinguish six attributes for verbs: their syntactic type (1), mood (2), tense (3), person (4), number (5) and aspect (6). The syntactic type (main/auxiliary) is a legacy from standard ME tagsets; it does not

denote any morphological feature. Attribute "mood" distinguishes finite forms (indicative, conditional) from non-finite ones (proper infinitive, participles). Tense is distinguished only in synthetic forms (aorist, imperfect, present). Negative prefix *ne* is separated even if it fuses with the stem (e.g. *nja+mam* 'I do not have'). As verbal voice is usually expressed by analytical means, it is not a part of the tag.

### 5.5.1. Tagset for verbs.

#### - V-type-mood-tense-person-number-aspect

- Type:

- M - main
- A - auxiliary

- Mood:

- I - indicative
- M - imperative
- N - infinitive
- O - conditional
- P - participle

- Tense:

- A - aorist
- I - imperfect
- P - present

- Person: 1/2/3

- Number: s/p

- Aspect:

- E - perfective
- I - imperfective

### 5.5.2. Differences from legacy tagsets

Our set resembles the BG and the HR, but the tag ends at position (5). Among other attributes, gender is not considered a verbal attribute (participles may be tagged as adjectives to reflect it), while voice and negation (i.e. presence of a *ne*-marker) are marked by syntactic annotation. Position (6) is newly filled with an aspect attribute (cf. below §5.5.7).

5.5.3. As with other categories, analytic constructions (future tense, infinitive) are not marked on the morphological level. Thus the tense of the main verb of the future tense is marked with P ("present"). Analytic constructions are marked at auxiliary verbs by syntactic annotation. As with the attribute "type" used for nouns and adjectives, the attribute is preserved in our system to ensure compatibility with other corpora annotated by MultextEast-based tagsets. For example, in *bgъ šte da proslavi stica+ta svoę* 'God will glorify His saint' (*Berl.d.*), the main verb *proslavi* would be tagged as VMIP3SE and the future marker *šte* as VAIP3SI.

5.5.4. In comparison to standardized Bulgarian, pre-standardized varieties also include synthetic infinitives (e.g. *ni+mózi postígna* 'cannot reach': VMN---E; *NBKM 1064*). The same tag is used also for older infinitives with the full desinence (e.g. *móžeš+li+mi dáti* 'could you give me', *PPS*).

5.5.5. Modern BG/MK use (1.) resultative (or *l-*) participles as main verbs of some compound tenses, (2.) passive past participles as main verbs with a passive meaning, and (3.) gerunds (bulg. *deepričastie*), based on old present active participles. In later texts, (4.) narrative constructions with *l*-participles built from imperfect stems occur as well. The resultative and passive suffix is extended by an adjectival ending expressing gender and number; this may be reflected by a secondary tag (only number is reflected by the verbal tag). Separate marking of the voice is unnecessary in newer varieties: it is fully expressed by the tense of the participle, for present passive/past active participles were abandoned:

1. resultative	-l-	<i>što+è tija stóřila</i> 'what she did' ( <i>Tixon.d.</i> )	VMP--E
2. gerund	-ki/-št-	<i>kopaiki grobo</i> 'digging the grave' ( <i>NBKM 728</i> )	VMPP-I
3. passive	-n/-t-	<i>što+sà smirėniř</i> 'who are meek' ( <i>Berl.d.</i> )	VMPA-E

4. narrative -/- **tečáľ** *na stáę* 'he ran to the saint (*Nedělník* 1806) VMPI-I

5.5.6. In archaic (CS) texts, which still use both present and past forms and both voices, voice can be explicitly distinguished in the syntactic annotation as a secondary tag of the auxiliary verb (cf. below §6.2.3.2.). If the participle is used as the main predicate of the sentence, inflection can be reflected in the secondary tag (all examples from Vuković 1536):

1. PRS active	-ę/-št-	<i>skázoujušte</i> 'saying'	VMPP-PE	AMPNN
2. PRS passive	-m-	<i>istávajema</i> 'being exposed'	VMPP-SE	AFSNN
3. PST active	-v(š)-	<i>stěžav'šii</i> 'having conquered'	VMPA-SI	AMSNY
4. PST passive	-n-/t-	<i>blsvénb</i> 'blessed'	VMPA-SI	AMSNN

Participles and gerunds directly dependent on nouns (e.g. *crstvujuštomu gradu* 'to the ruling city') are tagged as adjectives. A secondary tag may be mentioned to reflect the verbal attributes. If the participle serves as the main predicate of the sentence, the verbal tag may be used as the primary one. For example, *crstvujuštomu* would receive AMSDY (adjectival) as the primary tag and VMPP-SI (verbal) as the secondary one. In *što+sà smirénĭ*, the verbal tag is primary.

5.5.7. Aspect is handled as an inherent feature of the lemma. Previous ME tagsets used different methods: e.g. MK/UA/PL show it on the 2nd position, RU on the 9th, BG/SC do not reflect it at all. These tagsets usually list E and P as the options, with P denoting the imperfective ("progressive") aspect; this option was replaced with an I to avoid confusion. If the aspect cannot be unambiguously determined (e.g. in loanwords), the position remains empty.

5.5.8. Imperfect and aorist plural forms have likely undergone analogical levellings already in the Middle Bulgarian period (Mirčev 1978:215). Imperfect endings and aorist stems seem to have been preferred in the process. For this reason some of the modern forms, already attested in the earliest damaskini, are ambiguous (e.g. 3PL.AOR/IMPF *poslúšaxa* 'they obeyed'; *Tixon.d.*). As the generalized plural endings (-*xme*, -*xte*, -*xa*) reflect the old imperfect, tokens with them are tagged as imperfects too. Only if the token shows a clear reflex of an old aorist ending (-*xom*, -*ste*, -*šę*), it is marked as aorist (e.g. *tako satvoriša* 'thus they did': VMIA3PE; NBKM 328). Ambiguous 1SG.AOR/IMPF forms are resolved according to etymology: verbs with uncontracted IMPF stems (e.g. *ímęjaxb* 'I had': VMII1SI; Vuković 1536) are tagged as imperfects, the rest as aorists (e.g. *imax*: VMIA1SI; *Tixon.d.*).

## 5.6. Prepositions

Marked as "adpositions" in the tagset. The single attribute marks the nominal case or row, called by the adposition in Church Slavonic and other Slavic languages with preserved nominal inflection. By this we can distinguish e.g. *na* denoting location (tagged SL, e.g. *na zemli* 'on Earth') from those denoting direction or possession (both tagged SA, e.g. *na+ kúšta* 'of the house'). The choice is based on the classification by Lunt (2001:151 f.). This attribute helps us distinguish some homonymes. More recent prepositions (e.g. *spored* 'according to') have no case/row marking.

### 5.6.1. Tagset for prepositions.

#### - S-case

- Case:

G - e.g. *bez, do, radi, za* (causal)

D - e.g. *k, po* (lative), *pręmo, protivo*

A - e.g. *na, nad, za* (lative), *po* (causal)

L - e.g. *na, po, pri, v* (locative)

I - e.g. *meždu, nad, za*, (locative), *s*

### 5.5.2. Differences from legacy tagsets

The case marking has a precedent in the HR set, where it is used at position (3). Separate attributes for distinguishing of pre- and postpositions (usually marked at the first position), as well as between simple and compound ones, were considered redundant for our corpus. The first attribute is relevant for only two words used in CS (*radi* and *děľma* both 'because'), the second one is inferred in the syntactic annotation.

## 5.7 Particles

The single attribute reflects the type, which is a lexical category. This category is generally avoided due to its ambiguous definition. For example, *da* can be classified as both a conjunction ('so that') and a particle used in analytic verbal constructions. We prefer to mark it as a conjunction (C) to avoid confusion. This is a conventional choice: its syntactic function is reflected in another layer of annotation. The verbal particle *šte* (which can still be inflected by tense in the standard Bulgarian and by person in pre-standardized varieties) is marked as an auxiliary verb (i.e. VAIP3SI, for *šteše*: VAI13SI etc.). Ambiguous forms can also be explained by a secondary tag (e.g. *e* 'this' in *NBKM 1423*: both as QD and PP3NSN).

### 5.7.1. Tagset for particles.

#### - Q-type

- Type:

C - comparative (e.g. *po*, *nai*)

D - definitive (e.g. *eto*, *že*)

G - general (e.g. *dori*, *makar*, *sireč*)

O - modal (e.g. *mai*)

Q - interrogative (e.g. *dali*, *li*, *nali*, *eda*)

Z - negative (e.g. *ne*)

### 5.7.2. Differences from legacy tagsets

The particles are marked similarly as in the HR set. The number of options was extended with general and comparative ones, present in the BG set. Separate attribute for distinguishing between simple and compound particles (present in the BG and MK sets) was considered redundant: it can be inferred from the syntactic annotation. Particles denoting anaphoric and deictic relations are marked as "definitive", an option adopted from the Albanian tagset.

## 5.8. Others

Other parts of speech have no further specifications: adverbs (R; e.g. *tamo* 'there'), conjunctions (C; e.g. *i* 'and'), interjections (I; e.g. *o* 'oh') and non-verbal elements (X; e.g. †, ...). With such tokens, only the part-of-speech category is marked in the tag.

### 5.8.1. Differences from legacy tagsets

BG, HR, and MK sets use attributes "type" and "degree" for adverbs. Adverbial attribute "type" has multiple options in the MK set, but it is ambiguous: the difference between general (e.g. *dobro* 'well') and adjectival adverbs (e.g. *sigurno* 'surely') is arbitrary. Some of the types may be interpreted as other parts of speech, e.g. verbal adverbs (gerunds) are marked as participles (e.g. *kopaiki* 'while digging': VMPP-I; *NBKM 728*). The attribute "degree" is considered redundant, because the comparative and superlative markers are handled as separate tokens.

Furthermore BG, HR and MK sets distinguish two additional attributes for conjunctions: type (coordinating or subordinating) and formation (simple and compound). As these attributes reflect rather syntactic properties, the both were removed from our tagset.

Although preserved for special cases (e.g. markers of omission), the representation of non-verbal elements as separate tokens was by rule avoided during the process of annotation. In many of our sources, punctuation is not used systematically by the scribe (especially in *PPS*). For this reason, punctuation and other non-verbal symbols were attached to the preceding token. Unless analyzed as separate tokens, they are removed from the diplomatic transcripts and the CoNLL version of our files.

5.8.2. Some words are functionally ambiguous. Subordinating conjunctions, which may have either a temporal (e.g. *egda samna skaza pavelъ elika vide* 'as the dawn came, Paul explained what he saw; *NBKM 328*) or a conditional (e.g. *egda+ se+ sra\_mueši počto+ si prišalъ* 'if you feel shame, why did you come?'; *NBKM 328*) meaning, are tagged as adverbs (R). If the root can be extended with pronominal suffixes, it is tagged as a pronoun (cf. §5.3.7.).

The following lemmas are always marked as adverbs: *dnes, legoma, malko, mnogo* (inflected CS forms like F.SG.INST *mnógojù* in Vuković 1536 are classed as adjectives under the lemma *mnog*), *naedno, ošte, pak, paki, sega, skoro, tamo, toko, tokmo, tuk, tьi, tьčiju, vьn, vьtre, štom*.

The following lemmas are always marked as conjunctions: *a, ako, ala, ali, ami, andžak, ašte, bo, da, dano, zaedno, zam, zatova, zašto* (unless context would rather denote *za+ što*), *zaštoto, i, ibo, ili, jako* (only for CS 'if'; newer *jako* 'much, very, strongly' tagged as R), *jakože, kato, nelo, neti, ni, niže, nito, no, nь, obače, oti, pa, počto, poneže, ta, ubo, vьskuju, če, čunki*.

## 6. Syntactic tagset

### 6.1. Standard Tags

Syntax is marked on every token in three columns. The first column (UD\_ID) contains a number, which denotes the position of the word in the sentence. The second column (UD\_NCY) contains a number denoting the dependency of the element. Roots (sentence predicates) are tagged as 0. The third column (UD\_TYPE) defines the type of the relation. The corpus uses the standard tagset defined at the Universal Dependencies website ([link](#)).

- ACL - adjectival clause (root of a subordinate clause dependent on a nominal)
- ADVCL - adverbial clause (root of a subordinate clause dependent on a verb)
- ADVMOD - adverbial modifier (e.g. *síč'ko+to naednò oustávì* 'she left everything at once')
- AMOD - adjectival modifier (e.g. *stáę pétka* 'St Petka')
- APPOS - appositional modifier, modifying the immediately preceding noun (e.g. *sъs bráta+ř evoímìe* 'with her brother Euthymius')
- AUX - auxilla (usually 'be', 'have' or 'want' auxiliary verbs)
- CASE - analytic marking of an oblique nominal (usually an adposition)
- CC - coordinating conjunction (e.g. *dobrini i+zakrìlinìe* 'virtues and protection')
- CONJ - conjunct (dependent on first conjunct, e.g. in *dobrini i+zakrìlinìe*, *dobrini* will be tagged as OBJ and *zakrìlinìe* as CONJ)
- COP - copula
- CSUBJ - clausal subject
- DET - determiner (demonstratives, articles)
- EXPL - expletives: reflexive pronouns and doubled clitics
- FIXED - fixed multiple word expression (e.g. *ne+ ště da trъpì* 'she wouldn't wait')
- MARK - marker of subordinated clauses (usually a subordinating conjunction or relative pronoun, e.g. *sъzi katò wt kládenъsъb istíčaxa* 'tears poured as from a well', *da*-particle in *ne+ bě' neř támb da+ sa zatrìžì* 'there was no one there to care')
- NSUBJ - main sentence subject
- NMOD - nominal modifier (e.g. *xódinìe to ř* 'her journeys')
- NUMMOD - numeric modifier (e.g. *čétiry pьpřišta* '[distance of] four shots')
- OBJ - direct sentence object

OBL - nominal used as an oblique argument (e.g. in *Krstiteľ ěwán'na oupriličáwa sьs póstenie* 'she followed John the Baptist by fasting', *Krstiteľ* would be OBJ, *póstenie* OBL, and *ěwán'na* APPOS)  
 ORPHAN - used in case of a head ellipsis, where simple promotion (to a head) would result in unnatural/misleading dependency relation (e.g. due to missing object *da+ iz'rečè něĭ, déto+ gĭ na epivatъ struvaše* 'to tell of her [deeds?], which she did in Epibates'  
 REPARANDUM - reparandum: stricken tokens (depend on any adjacent non-stricken element in the sentence)  
 ROOT - head/predicate of the sentence  
 VOCATIVE - vocative

## 6.2. Tag Extensions

Some tags can optionally be extended for more specific relations, using the fourth column (UD\_EXT). Multiple extensions can be added, separated by colon <:>. When an elision causes the tagged word to be promoted to a clause head (i.e. ACL or ADVCL) or when it is marked as a conjunct (CONJ), it may receive the extension (e.g. *slъzĭ katò wt kládenъcъ ističaxa; Tixon.d.*) too.

The customization of our tagsets aims to unambiguously capture features, which are expressed in one variety synthetically (e.g. by a case ending) and analytically in another one (e.g. by a clitic). In this way, the corpus can include archaic, pre-standardized and contemporary dialectal material, allowing us its comparison across space and time.

6.2.1. One set of extensions is used with nominal modifiers (NMOD) and oblique arguments (OBL), describing their relation in a more specified way (e.g. as a spatial or possessive relation). This helps us distinguish various meanings of polysemic prepositions like *na*, or to analyze the marking of syntactic functions formerly represented by nominal case endings. The tag extensions are marked in a separate column (examples from *Berl.d.*):

ABL - ablative relation (e.g. *běše wt+ město epiváti* 'she was from the town of Epibates')  
 IOBJ - indirect object (e.g. *bъdí+ mĭ drugár'* 'be my comrade', lit. 'be to me a comrade')  
 LAT - allative relation (e.g. *wtídoxa v' nbsny" ográďi* 'they departed to the heavenly gardens')  
 LOC - locative relation (e.g. *po+ síč'ky světb* 'all over the world')  
 POSS - possessor (e.g. *sъs'+ bráta+ sí* 'with her brother')  
 XCOM - open clausal modifier (e.g. *bъdí+ mĭ drugár'* 'be my comrade')

6.2.2. Changes in use of determiners (extended and short clitic demonstratives) can similarly be reflected by the additional extension of the DET relation. The extension can be used after tags for nouns and adjectives, if the determiner is expressed by a vowel only (e.g. *a vinaro crevь reče* 'but the king's cupbearer said'; *PPS*). This is an extension, which is often combined with other ones: for example, in *života čoveko* 'the life of the human' (*NBKM 1069*) both endings seem to reflect definiteness, but in *čoveko* the relation is also that of a possessor. Thus its UD tag would be extended with P\_NOM:POSS, extensions are ordered alphabetically (examples from *Tixon.d.*):

EXT - an extended demonstrative (e.g. *tázi miriz'mà* 'the stench')  
 P\_ADJ - a postponed article following an adjective (e.g. *móí+ te móšti* 'my relics')  
 P\_NOM - a postponed article following a noun (e.g. *kov'čeg'+ t'+ sí* 'their coffin')

6.2.3. Periphrastic verbal constructions like perfect tenses or conditionals can be marked by adding the function tag to the auxiliary verb (AUX relation), markers of subjunctive relations (MARK) or their complements of fixed phrases (FIXED):

CON - conditional (e.g. *dší+te+sĭ bíx'me dàlĭ* 'we would give our souls away'; *Berl.d.*)  
 FUT - periphrastic future (e.g. *šte+ da+ reče+ tája+ réčb* 'he will say the word'; *NBKM 1069*)

INF - "infinitives" after auxiliary verbs (e.g. *šte+ da+ reče+ tája+ réčь* 'he will say the word'; NBKM 1069)  
 OPT - optative (e.g. *da ne viditъ+ nas neko* 'nobody should see us'; NBKM 238)  
 PASS - passive voice (e.g. *ispálnena mpési* 'she was filled'; NBKM 1064)  
 PRF - perfect/narrative mood (e.g. *togaī dīavoľь e+zavīdīľь* 'then the devil was jealous'; NBKM 728)  
 PPRF - plusquamperfect (e.g. *ťь'í+se běšě pod\_kánila* 'thus she had decided to live'; Tixon.d.)

6.2.3.1. The tag extension INF is applied to *da*-markers following verbs *moga* 'can' and *šta* 'want' (including variants like *hoču, ću* etc.), which in some dialects may complement synthetic infinitives (cf. Mirčev 1978:235), e.g. *polovina ot crstvoto si da štem* 'we would give a half of our kingdom (Tixon.d.). Other such verbs are *ima*: 'have' (incl. negative future marker *njama*), *načena* (cf. Lunt 2001:154), *počna, (v)zema* (e.g. *ze da vuni* 'it began to stink'; NBKM 1064) and *podbra (pudmpra da struva* 'she began to do [miracles]'; NBKM 1064) 'begin', *stiga, přěstana* 'stop' and the negative command *nedei* 'do not' (e.g. *nedei se gnusi* 'do not be disgusted; Tixon.d.). The extension serves to distinguish instances, where *da*-constructions have likely replaced synthetic infinitives, from other types of subordinated clauses. It is also able to recognize phrases with multiple main verbs after a single auxiliary verb, e.g. *Poněže ničto drúgoe táko dšu člčskoe ne+ móže da očisti i+ na pérvo\_obrazie da+ privedě kakvotъ pustýnnoe i+ bezmóľvnoe živénie*. 'Because nothing else is able to purify the human soul and to make it perfect so well as the silent life in a desert.' (Nedělnik 1806).

6.2.3.2. The current design of the morphological tagset does not allow us to distinguish the voice of verbal participles (cf. §5.5.6.). Although the problem is of less relevance to non-CS texts, the extension PASS can be used with present and past participles used as roots of subordinate clauses (ACL, ADVCL).

## 7. Annotation Examples

## 8. Character Sets

### 8.1. Cyrillic

А	а	ѐ	е	ї	і	о	о	Ѹ	у	Ш	š	Ј	ja	Ѣ	ě	Ѵ	v	’	’
Б	b	Ѕ	z	К	k	П	p	Ф	f	Ц	št	Ј	je	Ѓ	ǰ	Ѷ	ψ		
В	v	Ж	ž	Л	l	Р	r	Х	x	Ъ	ъ	Ю	ju	І	ı	Џ	ž		
Г	g	З	z	М	m	С	s	Ў	č	Ы	y	А	ę	Ц	ц	Ω	w		
Д	d	Н	i	Н	n	Т	t	Ц	c	Ь	ь	Ѧ	q	Ω	ε	Оу	ou		

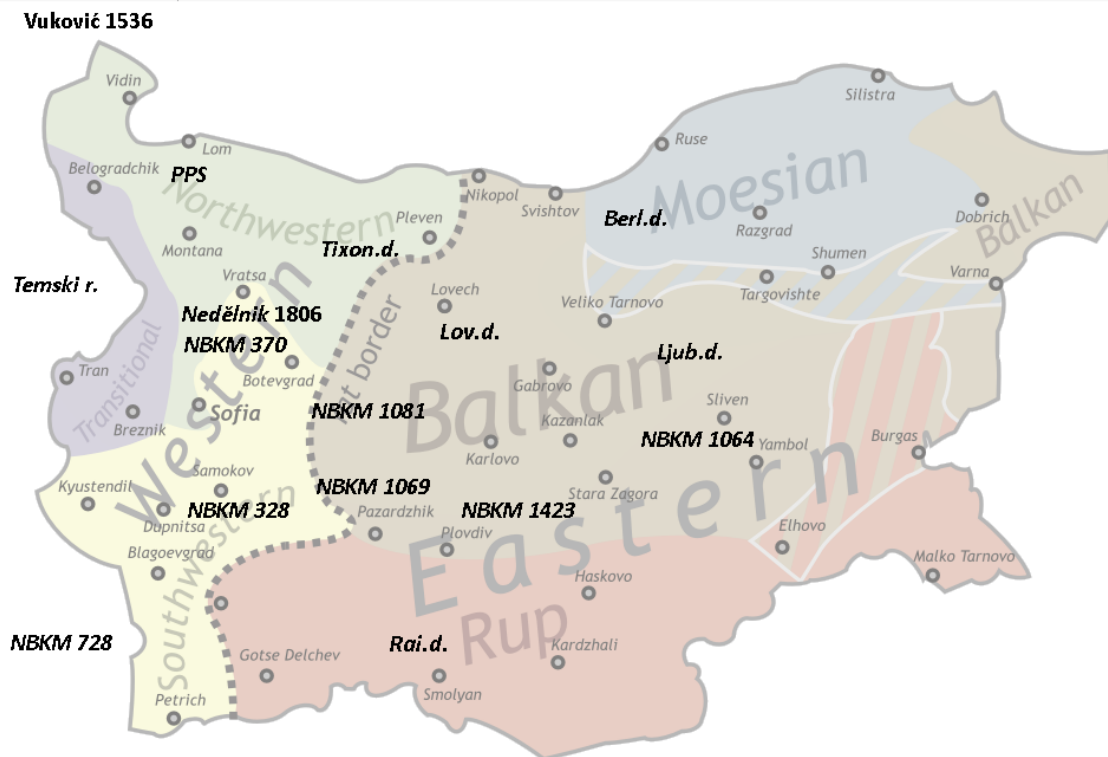

The above set is based on the Resava orthography. It may be accustomed for an individual text. The superscripted letters are written in line with the rest of the word: e.g. the common digraph  $\bar{w}$  is written as *wt*. The sequence  $\mathbf{шт}$  (adopted in literary Macedonian) is transcribed as *št*. The accent (´, ` , ^) is marked on the letter, if the combination can be represented by a single UTF character (e.g. *á*). Otherwise, it is written after the vowel (e.g. *ę´*). Double gravis accent (*kendima*), whose function is ambiguous, is marked always after the vowel (e.g. *y˘*). In the same way we mark breves over other sequence-final vowels than *ǰ* (e.g. *ę̆*). Spirits (´, `) aren't marked in the corpus, if not defined otherwise. Broad (ε, o, m) and space-saving (q) variants of certain letters (excl. *paerčik*) are not distinguished.

### 8.2. Greek

α	a	ε	e	κ	k	ο	o	ς	s	φ	f	ια	ja
β	v	ζ	z	λ	l	π	p	ς	št	χ	x	ιξ	ju
θ	v	η	i	μ	m	ω	p	τ	t	ν	v	ιω	jw
γ	g	ι	i	ν	n	ρ	r	φ	t	ψ	ψ	τζ	tz
δ	d	θ	ε	ξ	ž	σ	s	υ	u	ω	w		

Manuscript *NBKM 1064* uses a variant of the modern Greek script based on the Garamond typeface, which has been taught at schools in Southern Bulgaria in the 19th century. Other sources using the script, which are considered for inclusion in the corpus, are the *damaskini NBKM 345* from 1752 and *NBIV 600* from 1860, which both represent dialectal varieties of the Rup area. The above mentioned transliteration methods are also followed in this document.

## 9. Maps

9.1. Approximate localization of sources on the map of dialects in Bulgaria
